Show your work!

You may not give or receive any assistance during a test, including but not limited to using notes, phones, calculators, computers, or another student's solutions. (You may ask me questions.)

1. Suppose f and g are differentiable functions with the following properties:

$$\begin{array}{lll}
 f(0) = 2 & f(1) = 0 & f(2) = 1 \\
 g(0) = 1 & g(1) = 2 & g(2) = 0 \\
 \int_0^1 f(x) dx = \pi & \int_1^2 f(x) dx = \pi^3 & \int_2^3 f(x) dx = \pi^5 \\
 \int_0^1 g(x) dx = \sqrt{2} & \int_1^2 g(x) dx = \sqrt{3} & \int_2^3 g(x) dx = \sqrt{5} \\
 f'(0) = e & f'(1) = e^3 & f'(2) = e^5 \\
 g'(0) = \sqrt{7} & g'(1) = \sqrt{11} & g'(2) = \sqrt{13}
 \end{array}$$

Evaluate the following. If one cannot be evaluated with the given information, write "NOT ENOUGH INFORMATION." You do **not** need to justify your answer or show your work.

$$/2 \quad (a) \quad \int_0^3 g(x) dx = \int_0^1 g(x) dx + \int_1^2 g(x) dx + \int_2^3 g(x) dx = \sqrt{2} + \sqrt{3} + \sqrt{5}$$

$$/2 \quad (b) \quad \int_3^2 f(x) dx = - \int_2^3 f(x) dx = -\pi^5$$

$$/2 \quad (c) \quad \int_1^2 (5g(x) + f(x)) dx = 5 \int_1^2 g(x) dx + \int_1^2 f(x) dx = 5\sqrt{3} + \pi^3$$

$$/2 \quad (d) \quad \int_0^2 \frac{f(x)}{g(x)} dx \quad \text{Not enough information.}$$

$$/2 \quad (e) \quad \left(\frac{f}{g}\right)'(0) = \frac{f'(0)g(0) - f(0)g'(0)}{(g(0))^2} = \frac{e \cdot 1 - 2\sqrt{7}}{1^2}$$

$$/2 \quad (f) \quad \int_0^9 f(x) dx - \int_2^9 f(x) dx = \int_0^1 f(x) dx + \int_1^2 f(x) dx = \pi + \pi^3$$

$$/2 \quad (g) \quad \int_0^2 g'(r) dr = g(2) - g(0) = 0 - 1$$

$$/2 \quad (h) \quad \int_7^7 g''(x) dx = 0$$

$$/2 \quad (i) \quad \lim_{x \rightarrow 0} \frac{f(x) - 1}{g(x)} = \frac{2 - 1}{1} = 1$$

$$/2 \quad (j) \quad \lim_{h \rightarrow 0} \frac{g(1+h) - 2}{h} = g'(1) = \sqrt{11}$$

- /10 2. Use the Midpoint rule with $n = 4$ to approximate the integral. (Do **not** simplify.) Include a drawing of your subdivision of the interval and the midpoints used in the approximation.

$$\int_1^9 \sin(\sqrt{x}) dx$$

[Similar to 5.2#11] The interval $[a, b] = [1, 9]$ has length 8 and we are using 4 rectangles, so the width of each rectangle is $\Delta x = 2$. The base of the first rectangle is $[1, 3]$, which has midpoint $x_1^* = 2$. The second has base $[3, 5]$ and midpoint $x_2^* = 4$, the third has base $[5, 7]$ and midpoint $x_3^* = 6$, and the fourth has base $[7, 9]$ and midpoint $x_4^* = 8$. The area estimate is thus

$$f(x_1^*)\Delta x + f(x_2^*)\Delta x + f(x_3^*)\Delta x + f(x_4^*)\Delta x = \sin(\sqrt{2}) \cdot 2 + \sin(\sqrt{4}) \cdot 2 + \sin(\sqrt{6}) \cdot 2 + \sin(\sqrt{8}) \cdot 2.$$

- /10 3. The velocity of a fox increased steadily during the first three seconds it tried to catch a rabbit. Its velocity at half second intervals is given in the table. Find good upper and lower estimates for the distance that it traveled during these three seconds. Do **not** simplify.

t (s)	0	.5	1	1.5	2	2.5	3
v (ft/s)	0	5.2	10.8	14.9	18.1	19.6	20.2

Since its velocity is increasing, using the left edge of each time interval will give a lower estimate and using the right edge will give an upper estimate. The lower estimate is

$$\frac{1}{2} (0 + 5.2 + 10.8 + 14.9 + 18.1 + 19.6) \text{ ft}$$

and the upper estimate is

$$\frac{1}{2} (5.2 + 10.8 + 14.9 + 18.1 + 19.6 + 20.2) \text{ ft}.$$

- /10 4. Sketch the function $f(x) = 3 + \sqrt{4 - x^2}$ on the interval $[-2, 2]$.

Then evaluate the integral $\int_{-2}^2 f(x) dx$ by interpreting it in terms of areas.

[Similar to 5.2#29-36]

The integral is the area of a rectangle plus the area of half a disc. The rectangle has width 4 and height 3 and so area 12. The disc has radius 2 and so the half disc has area $\frac{1}{2}\pi 2^2 = 2\pi$. Thus

$$\int_{-2}^2 f(x) dx = 12 + 2\pi.$$

5. Evaluate the integrals. Do **not** simplify the result.

/6 (a) $\int_{-3}^2 (x^2 - 5) dx =$ [Similar to 5.3#1]
 $= x^3/3 - 5x \Big|_{-3}^2 = (2^3/3 - 5 \cdot 2) - ((-3)^3/3 - 5(-3)).$

/6 (b) $\int_1^\pi \frac{x^4 + 3}{x} dx =$ [Similar to 5.3#23]
 $= \int_1^\pi x^3 + \frac{3}{x} dx = x^4/4 + 3 \ln(|x|) \Big|_1^\pi = (\pi^4/4 + 3 \ln(\pi)) - (1^4/4 + 3 \ln(1)).$

/6 (c) $\int (x + 2)(3\sqrt{x} + 5) dx =$ [Similar to 5.3#5 and 11]
 $= \int 3x^{3/2} + 5x + 6x^{1/2} + 10 dx = 3 \frac{x^{5/2}}{5/2} + 5 \frac{x^2}{2} + 6 \frac{x^{3/2}}{3/2} + 10x + C.$

/6 (d) $\int_0^{1/2} \frac{5}{\sqrt{1-t^2}} dt =$ [Similar to 5.3#21]
 $= 5 \arcsin(t) \Big|_0^{1/2} = 5 \arcsin(1/2) - 5 \arcsin(0).$

/6 (e) $\int_2^3 10^{x+7} dx =$ [Similar to 5.3#15 and 25]
 $= 10^7 \frac{10^x}{\ln(10)} \Big|_2^3 = 10^7 \frac{10^3}{\ln(10)} - 10^7 \frac{10^2}{\ln(10)}.$

6. A cone-shaped drinking cup is made from a circular piece of paper of radius 5 in by cutting out a sector and joining the edges CA and CB . Find the maximum capacity of such a cup.

[Similar to 4.5#29] A side view of the cone-shaped cup is the triangle

The volume of the cone is $V = \frac{1}{3}\pi r^2 h$. The pythagorean theorem gives the constraint $(5 \text{ in})^2 = r^2 + h^2$. Solving for r^2 gives $r^2 = (5 \text{ in})^2 - h^2$ and substituting into V gives

$$V = \frac{1}{3}\pi((5 \text{ in})^2 - h^2)h.$$

Differentiating with respect to h gives

$$V' = \frac{1}{3}\pi((5 \text{ in})^2 - 3h^2)$$

and differentiating again gives

$$V'' = \frac{1}{3}\pi(-6h).$$

Setting $V' = 0$ yields $h = \frac{5}{\sqrt{3}}$ in as the only positive critical number. Since $V'' < 0$ for $h > 0$, this critical number gives a maximum. Inserting into V gives the maximum volume

$$V = \frac{1}{3}\pi \left(5^2 - \frac{5^2}{3} \right) \frac{5}{\sqrt{3}} \text{ in}^3 = \frac{2 \cdot 5^3 \pi}{3^2 \sqrt{3}} \text{ in}^3.$$
